

BoB for API Migration Assessment (APIC v5 -> v10)

Current Challenge

- Manually analyzing APIs for migration complexity is time-consuming and error-prone.
- Teams have to inspect specifications, policies, and backend dependencies one by one, making it difficult to get a complete and consistent view.
- In platforms like IBM API Connect, complex assemblies and environment-specific configurations further increase the difficulty. As a result, manual analysis slows down decision-making, introduces inconsistencies, and raises the risk of migration failures or rework.

Future Experience

- Leverage IBM BOB for Migration assessment to get detailed complexity assessment for each API and Specific migration challenges and warnings
- Step-by-step migration recommendations and v10 best practices for each API
- Side-by-side v5 vs v10 comparison along with recommended migration strategy
- Code examples and refactoring suggestions
- Common pitfalls to avoid

Business Outcomes

- ✓ Faster Analysis of migration complexity assessment
- ✓ Faster Time to Market
- ✓ Eliminates Manual intervention
- ✓ Reduced Overhead
- ✓ Improve Developer Productivity
- ✓ Improve Migration Planning
