

Enterprise secure coding with AI

Eliminate hardcoded secrets using IBM Bob, Vault
and MCP Gateway

Secret exposure is a top security threat, with good reason

Enterprises are adopting AI coding assistants to accelerate SDLC

Execute multi-step workflows, not just suggestions

Outcomes require orchestration, retries, and validation, not one-off prompts.

Operate across the full SDLC within existing environments

Value is unlocked when AI operates inside existing delivery pipelines, not alongside them.

Understand entire repositories, repositories, not isolated files

Safe orchestration requires repository-level context, not just single-file reasoning.

Embed governance, security and human oversight by design

Enterprise AI must enforce policy, security and accountability as work happens.

In addition to **hardcoded secrets**, this shift introduces new risks such as **inconsistent security enforcement**, and **uncontrolled AI access to backend systems**.

How to solve this problem at
Enterprise Scale?

Enterprise grade Secure Coding framework deployment example with IBM Bob, HashiCorp Vault and MCP Gateway

IBM Bob:

- ❖ Shift left security & compliance
- ❖ Embedded scans, approvals and auditability
- ❖ Enforce standards with minimal overhead
- ❖ Enforce governance into workflows

HashiCorp Vault:

- ❖ Centralized secret management
- ❖ Provide Just In Time (JIT) secrets
- ❖ Least privilege enforcement
- ❖ Policy driven timebound access
- ❖ Full auditability

MCP Gateway:

- ❖ Fine-grained tool access
- ❖ Enforce security policies
- ❖ Rate limiting & Throttling
- ❖ Full auditability

Demo

Let's see it in action!
