

Intent2Integration

AI-Driven FlowPilot Journey with IBM Bob

Current Challenge

- Locked into a single vendor-native AI coding experience
- Flow Service logic is hard to review, compare and maintain
- Naming, logging and error-handling standards applied late and inconsistently
- Documentation and test coverage lag behind fast-changing integration logic

Future Experience

- Flexible BYO-AI: bring IBM Bob or any enterprise-approved AI assistant
- AI guided by webMethods platform context via Flow Pilot; Flow Script is readable by design
- Standards-aware development embeds naming, logging, error handling and reusable patterns earlier
- Docs and tests generated in flow — modernizes the dev experience without replatforming

Business Outcomes

X%*

Less manual coding and review effort

5X Faster

Integration delivery, from intent to Flow Service

- 1 **Natural-language intent capture**
Architect describes the integration goal in plain English.
- 2 **AI-assisted Flow Service generation**
Bob + Flow Pilot draft, explain, and document the Flow Service.
- 3 **Governance preserved end-to-end**
Human review, source control and standards stay in the loop.
- 4 **Faster delivery, same trusted runtime**
webMethods Integration Server executes — nothing new to run.

**Illustrative — update with pilot results*
Human review, source control and standards stay in the loop.
