

IBM Bob Powered Test Automation for IBM Maximo Application Suite

Automated generation, execution and reporting of API test cases using MCP Servers, OpenAPI schema discovery and a custom Bob mode

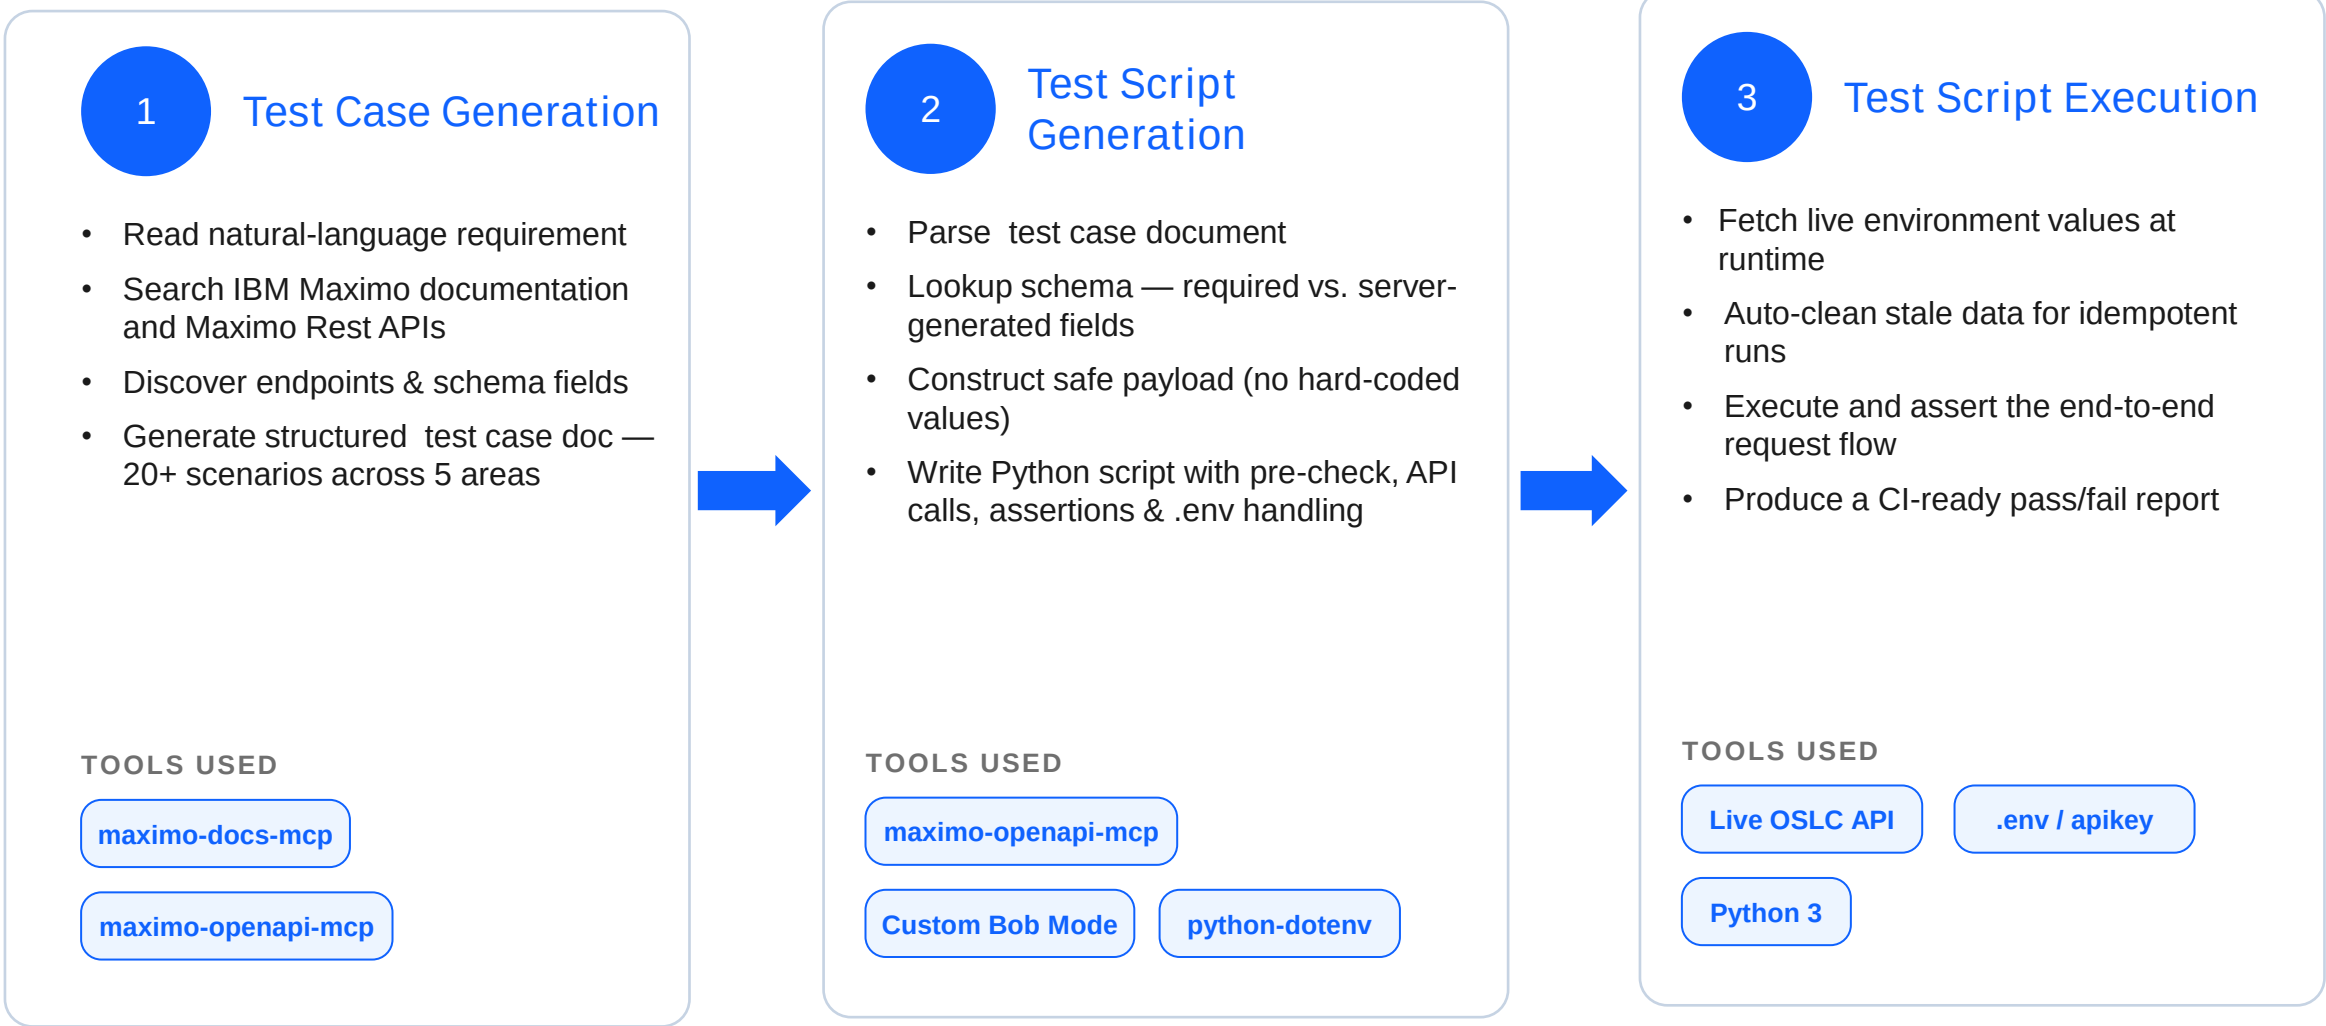

Current Challenge

- Manual, error-prone authoring — hand-written test cases invite mistakes and missed scenarios
- Slow manual test creation — every case is written by hand, limiting speed and consistency
- Payloads constructed without the live OpenAPI schema — field errors and rejected requests
- Environment values (site, org, classification IDs) hard-coded — fails across environments
- No pre-run cleanup — stale records from prior runs silently corrupt results
- No structured output — pass/fail determined by manual log reading

Future Experience

- Natural-language requirements auto-converted to structured test case documents — grounded in live schema and IBM product documentation via MCP servers
- Custom Bob mode (Maximo Python Test Writer) orchestrates schema lookup, payload construction and script generation in one prompt
- Runtime discovery resolves site, org and classification values from the live OSLC collection — zero environment-specific config
- Pre-check phase auto-deletes stale data before each run — fully idempotent execution
- Structured Markdown result report written automatically after every run — ready for CI integration

Solution Workflow

Business Outcomes

- Zero Manual** hand-written test cases fully eliminated
- 100% Executable** Every generated test runs live on first attempt
- 5X Faster** Test cycle vs. manual UI-based validation
- 20+ TCs** Test cases generated in minutes for a given requirement
