

Bob Assisted Maximo Modernization

Java-to-Python conversion and automated test generation for Maximo using IBM Bob

Current Challenge

- Monolithic Java customization combined lifecycle logic, validations, actions, and SLA conditions.
- Manual responsibility mapping to Maximo launch points is slow and dependent on SME knowledge.
- Regression testing across scenarios, statuses, and related records requires heavy manual effort.
- Documentation, traceability, and repeatable test assets are often missing in legacy customizations.

Future Experience

- Bob automatically discovers and analyzes legacy Maximo Java customizations from any source (like Cloud Object Storage, Git, ..)
- Modular Python automation scripts are generated with consistent coding patterns
- Test plans, YAML scenarios, seed data, and API runners are produced alongside the scripts

Business Outcomes

Team

IBM APAC Client Engineering

Solution Workflow

Data Source:

- Sample Maximo Java Code

Architecture:

- Bob discovers Java source, analyzes methods, and groups logic by responsibility.
- It generates deployable OBJECT, ATTRIBUTE, ACTION, and CONDITION scripts with consistent patterns.
- It also creates test plans, YAML scenarios, seed data, and API runners for rapid validation.
- Teams can review, refine, and deploy outputs faster with clearer traceability.
