

Claim validation process Acceleration

Transforming Insurance Claims with
Agentic AI and Automation

Traditional Claims Process

Business Challenges :

- ❖ Manual & repetitive processes
- ❖ Delays in claims validation & fraud detection
- ❖ Siloed data across legacy systems
- ❖ High Operational costs & limited scalability
- ❖ Poor customer satisfaction due to long processing times

Risks :

- ❖ Ungoverned access to privileged systems
- ❖ Data Leakage or Breaches
- ❖ Inconsistent handling of claims
- ❖ Inadequate Fraud detection capabilities
- ❖ Human errors in Data Entry or review

Introducing Agentic AI - Powered Automated Claims validation workflow

Accelerated Claims Validation Process with Agentic AI & Automation

01

Customer Submits a Claim

The customer logs into the portal/app and submits their claim details online.

02

System Initiates the Review Process. *A smart workflow engine begins processing the claim automatically.*

03

AI Assisted Human Review. *A Claim Analyst reviews suspicious or borderline cases. The claim is either rejected or approved*

04

Continuous Intelligence & Optimization
Use insights to enhance AI, processes & decisions continually

Outcomes:

- ❖ Increased operational efficiency
- ❖ Faster claims validation & settlement
- ❖ Seamless integration & data flow
- ❖ Intelligent Fraud Detection
- ❖ Improved Security & Access Control
- ❖ Scalable & Adaptive Workflows

Powered By:

- ❖ **Hybrid iPass** to provide seamless & scalable data flow securely
- ❖ **HashiCorp Vault** to protect access to privileged systems
- ❖ **Watsonx Assistant** to augment Claims Analyst capabilities
- ❖ **Watsonx Orchestrate** to deploy autonomous AI Agents to do anomaly & fraud detection

Benefits:

- ❖ Improved Accuracy & Compliance
- ❖ Reduced Risk Exposure
- ❖ Lower Operational Costs
- ❖ Enhanced Customer Experience
- ❖ Continuous Improvement

Accelerated Claims Validation Process with Agentic AI & Automation

02

System Initiates the Review Process. *A smart workflow engine begins processing the claim automatically.*

Policy Validation : Is There a Valid Policy?

The system checks Policy Management System to confirm the customer has a valid policy

Claim Validation – System Makes an Initial Decision. *The system decides if the claim is valid*

Claim is Registered in CMS. *The system adds the claim to the official claim management system.*

AI Flags the Claim for Fraud. *The system uses Autonomous AI Agents to detect patterns, anomalies and potential fraud.*

Value of this solution over simple automation & static models

 Area	 Simple Automation & Static Models	 Agentic AI Solution
Decision-Making	Binary model outputs; deterministic rules	Autonomous decision agents (e.g., adaptive, contextual decision-making based on evidence, past cases, risk appetite)
Proactive Reasoning	Reactive to claim triggers only	Agents actively seek additional context, query third-party APIs, cross-reference historic patterns before decision
Multi-Agent Collaboration	Isolated model outputs, handled sequentially	Fraud Detection Agent collaborates with Anomaly Agent + Decision Maker Agent to jointly evaluate and debate evidence before final action
Explainability	Simple model score outputs	Agents can generate human-readable justifications for decisions (e.g., “Claim flagged because pattern X matches known fraud cases Y and recent anomaly Z”)
Adaptability & Learning	Retrain models offline, periodically	Agents learn continuously, adjust thresholds, seek new patterns based on recent cases autonomously
Human-in-the-Loop Orchestration	Manual intervention at static points	Agents decide when to escalate, request additional evidence, or involve human supervisors dynamically
Process Optimization	Static workflows, based on pre-defined steps	Agents can suggest changes in the workflow (e.g., bypass certain checks for low-risk claims)

Use Case Solution Architecture
